

## Scytec DataXchange License Levels

Scytec DataXchange offers two distinct license levels, giving manufacturers the flexibility to scale their machine monitoring capabilities based on their specific needs and budget. These licensing options define the type of data that can be collected, ranging from basic cycle status to detailed downtime, part counts, and OEE metrics. You can even mix and match license levels across your equipment, allowing each machine to collect only the data that's most relevant to its role in your operation.

### Silver

Start with the **Silver** license level to gain reliable visibility into machine cycle status and instantly know whether a machine is running or idle. This tier includes unlimited access to real-time manufacturing dashboards, charts, and reporting tools across all device types, from desktops to mobile, helping you monitor your operations anytime, anywhere.

With the Silver license level, manufacturers gain deep insight by distinguishing between planned and unplanned machine downtimes, while also collecting operator entered downtime reasons with the **Operator Data Interface (ODI)**. Stay informed in real-time with instant notifications sent via Microsoft Teams, text, or email, delivering the responsive visibility your team needs to act quickly and effectively.

### Gold

Manufacturers looking for advanced features on the **Gold** license can unlock deeper production analytics, including alarm collection and detail, tracking of good and scrap part counts, and part numbers. The Gold level also features OEE (Overall Equipment Effectiveness) calculations for accurate performance insights.

The Gold level also enables manufacturers to define ideal cycle times and ideal setup times, giving manufacturers a clear performance baseline to measure how machines and teams should run under optimal conditions. Accurate ideal times improves scheduling, quoting, and planning, helping manufacturers produce more parts on time while reducing costs and maximizing overall equipment effectiveness (OEE).
